

Data Preparation and Business Questions

Date	15 July 2026
Project Name	Strategic Product Placement Analysis

Data Preparation

The Product Positioning dataset (1,000 records, 10 fields) was collected in CSV format and prepared for analysis using Tableau. The dataset was examined for missing values, duplicate records, and inconsistent entries before being connected to Tableau. Categorical fields were standardized and numeric fields were validated to ensure a reliable, consistent analysis.

Data Preparation Steps

- Collected the Product Positioning dataset (1,000 records, 10 fields).
- Verified there were no missing or duplicate records across the dataset.
- Standardized categorical fields: Product Position, Promotion, Foot Traffic, Consumer Demographics, Product Category, and Seasonal.
- Set correct data types for Price, Competitor's Price, and Sales Volume as numeric measures.
- Connected the cleaned dataset to Tableau Desktop.
- Created worksheets, a dashboard, and a story for visualization.

Business Questions

The project addresses the following business questions:

1. Which product position (Aisle, End-cap, Front of Store) generates the highest average sales volume?
2. Which product category (Clothing, Electronics, Food) performs best in terms of sales?
3. How does foot traffic level affect average sales volume?
4. Which consumer demographic segment drives the most sales?
5. What impact do promotions have on price and sales volume?
6. How does product pricing compare to competitor pricing across categories?
7. Which position-and-category combination yields the highest sales, and what recommendations can improve the overall product placement strategy?
