

PROJECT SUMMARY

Date:	15 July 2026
Project Name:	Strategic Product Placement Analysis

Project Summary

The **Strategic Product Placement Analysis** project was developed to examine the relationship between **product positioning, sales performance, pricing strategies, promotional activities, and consumer behaviour** using modern data analytics and visualization techniques. The project transforms retail sales data into meaningful business insights through interactive Tableau dashboards, enabling organizations to make informed decisions regarding product placement and marketing strategies.

The dataset was collected in CSV format and prepared for analysis through data cleaning and preprocessing. The processed dataset was connected to **Tableau Desktop**, where interactive worksheets, dashboards, and stories were developed to analyze product categories, product positioning, pricing, promotional campaigns, seasonal trends, customer demographics, and sales performance. The dashboards were published to **Tableau Public**, providing an intuitive platform for exploring business insights through interactive visualizations.

Objectives Achieved

- Collected and prepared the product positioning dataset.
- Performed data cleaning and preprocessing for accurate analysis.
- Connected the prepared dataset to Tableau Desktop.
- Developed interactive Tableau worksheets and dashboards.
- Analyzed the relationship between product positioning and sales performance.
- Examined the influence of competitor pricing on product sales.
- Evaluated consumer demographics and purchasing behavior.
- Investigated seasonal trends affecting product demand.
- Assessed the impact of promotional campaigns on sales volume.
- Published dashboards through Tableau Public.
- Maintained complete project documentation.

Technologies Used

- Tableau Desktop
- Tableau Public
- Microsoft Excel / CSV

- HTML5
 - CSS3
 - Bootstrap 5
 - Git & GitHub
-

Key Outcomes

- Developed interactive dashboards for analyzing product positioning strategies.
 - Identified the relationship between product placement and average sales volume.
 - Compared competitor pricing with product pricing to evaluate market competitiveness.
 - Analyzed consumer demographics and their influence on purchasing behavior.
 - Measured the impact of promotional campaigns on product sales.
 - Examined seasonal variations in sales across different product categories.
 - Evaluated the relationship between foot traffic and sales performance.
 - Generated actionable business insights to improve product positioning and maximize revenue through data-driven decision-making.
-

Future Enhancements

- Integrate real-time retail sales data into Tableau dashboards.
 - Develop machine learning models for sales forecasting.
 - Perform advanced customer segmentation and recommendation analysis.
 - Incorporate predictive analytics for pricing optimization.
 - Enhance dashboard interactivity with advanced Tableau features.
 - Deploy the complete analytics solution as a cloud-based business intelligence platform.
-

Conclusion

The **Strategic Product Placement Analysis** project successfully demonstrates how data visualization and business analytics can be used to understand the impact of product positioning on sales performance and consumer behavior. By leveraging **Tableau Desktop** and **Tableau Public**, the project transforms retail data into interactive dashboards that support strategic business decisions. The visualizations provide valuable insights into product placement, pricing strategies, promotional effectiveness, customer demographics, seasonal trends, and overall sales performance. The project successfully achieves its objectives and establishes a strong foundation for future enhancements, including predictive analytics, realtime data integration, and advanced retail intelligence solutions.
